

Southwest Australia is one of five Mediterranean-type ecosystem 'global' hotspots. Covering an area of 357,000 square kilometres - with less than 107,000 square kilometres of remnant vegetation remaining – it is home to over 2,948 endemic plant species growing in some of the most ancient landforms on earth. It has an increasing number of critically endangered and threatened flora and fauna species.

It is here the Shire of Toodyay - and our club - are located.
